Hebert Nursing Home (PWSID 2000083) is a community water system in Smithfield that serves approximately 227 residents and employees. The water system consists of two drilled wells. Water is discharged to four water storage tanks, filtered and then distributed. The last sanitary survey was May 23, 2002. For further information contact Paul Joseph Hebert at 180 Log Road, Smithfield, RI 02917.

**Treatment:**
Water is filtered through a blend of calcium carbonate, magnesium oxide, and garnet for corrosion control and iron removal.

**The Source Protection Area** is a circle of radius 2,211 feet, or about 350 acres (see Figure 2 on back). It is mostly wooded, with Stillwater Reservoir crossing the eastern and northern portions. Land uses include moderate density residential development and agriculture, along with institutional, commercial, and industrial development (see Table 1 on back).

**Sample Summary** (for the previous five years)
- Fecal coliform bacteria were not detected. Coliform bacteria were detected twice during this period. However, re-sampling revealed that the problem had been corrected.
- Nitrate levels in groundwater have been consistently low.
- No violations of the standards for other regulated contaminants have been identified. However, there have been detections below levels considered acceptable by US EPA. This indicates the need for continued monitoring.

**This report** summarizes assessment results for this water system. The assessment identifies both known and potential sources of pollution occurring in the source protection area, and ranks the water source based on the likelihood of future contamination. The goal of this study is to help water suppliers, local officials, residents and consumers to learn more about source water protection. Because water quality is directly related to land use activities, everyone living or working in the source protection area has a role to play in keeping local water supplies safe.

**POLLUTION RISKS:**
- High-intensity land uses, including institutional and residential, are clustered near the wells.
- Several roads are located near the wells, increasing the risk of hazardous material spills and road salt contamination.
- The industrial complex inside the protection area is a potential source of historic contamination.

**PROTECTION OPPORTUNITIES:**
- Some of the source protection area consists of undeveloped forestland.
- The town can implement land use controls and programs to protect this source protection area from high-intensity development.
- The town and supplier can encourage institutions, businesses, and farmers to use best management practices in handling potential contaminants.
- Residents can follow the guidelines on the back to reduce the impact of household contaminants.
Table 1. High-intensity land uses identified within the source water protection area that have the potential to contaminate drinking water.

<table>
<thead>
<tr>
<th>Land Use Category</th>
<th>Associated Contaminants</th>
<th>% of Protection Area</th>
</tr>

<td>6.6%</td>
</tr>
<tr>
<td>% Intensive Agriculture</td>
<td>Nutrients, Pathogens, VOCs, SOCs</td>
<td>6.7%</td>
</tr>
</tbody>
</table>

1Potential contaminants include nutrients (nitrates and phosphorus from fertilizers and human and animal waste), pathogens (bacteria, viruses, and other microorganisms that can cause disease); volatile organic compounds (VOCs) found in fuels and solvents; synthetic organic compounds (SOCs), such as pesticides and plastics; and inorganics, including metals and other substances that can harm human health in high concentrations.

Figure 2. Areas of high-intensity land use are shown in dark gray.

What You Can Do To Protect Water Quality

**Public Water Suppliers:**
- Implement all recommendations in the latest Sanitary Survey.
- Protect undeveloped land within the wellhead or watershed protection area. Work with municipal boards and government as needed to implement land use protection measures and education programs.
- Post signs alerting public to Wellhead or Watershed Protection Area.
- Inspect water supply and protection area regularly for potential pollution sources.

**Municipal Boards and Government:**
- Develop a groundwater protection plan and ordinance and supporting protective zoning regulations, such as limits of paved surface areas within new developments.
- Incorporate groundwater and source water protection goals into the Comprehensive Plan.
- Implement on-site wastewater management or sewer maintenance plans and ordinances.
- Develop programs for land acquisition, conservation easements, or other critical lands protection.
- Adopt a stormwater management plan and ordinance.
- Establish a community education and outreach program that promotes residential pollution prevention and best management practices for the Public Works Department.

**Residents:**
- Inspect septic systems annually and pump as needed.
- Replace/repair cesspools and failing septic systems.
- Reduce fertilizer and pesticide use.
- Reduce stormwater runoff by limiting paved surface areas and maintaining good vegetative cover.
- Pick up after your pets.
- Properly use, store, and dispose of hazardous products.
- Properly maintain motor vehicles and fuel storage tanks.
- Consider replacing underground storage tanks with properly contained above-ground tanks.
- Check all municipal laws that may apply.

**Farmers and Landowners:** Develop conservation plans on agricultural and forest lands that:
- Reduce soil erosion, sediment, and stormwater runoff.
- Address proper nutrient, manure, pest, and irrigation water management.
- Address proper fuel storage and equipment maintenance.
- Conserve water, improve soil health, and protect surrounding natural resources.
- Check all federal and state laws that apply.

**Commercial and Industrial Businesses:** Adhere to all laws, regulations, and recommended practices for:
- Hazardous waste management
- Above- and underground storage tanks
- Wastewater discharge
- Floor drains
- Proper training for all employees
