The Woodpecker Hill Nursing Home (PWSID 2000004) is a community water system in Coventry that serves approximately 43 residents through 7 service connections. The water system consists of one drilled well. An unapproved dug well #2 supplies two outside spigots on the nursing home. Virginia Pond provides water to fire protection tank/fire sprinkler system for the nursing home and the rock garden spigot. Many changes to the water system have been planned including removal and replacement of water tanks and removal/replacement of underground fuel storage tanks. The last sanitary survey was June 5, 2001. For further information contact John F. Couture at 2052 Plainfield Pike, Greene, RI 02827.

The Source Protection Area is a circle of radius 2,008 feet, or about 290 acres (see Figure 2 on back). It is mostly wooded with some commercial, pasture, and low density residential areas. A waste disposal site is located south of the well (see Table 1 on back).

Sample Summary (for the previous five years)
▲ Bacteria have not been detected.
▲ Nitrate levels in groundwater have been consistently low.
▲ No violations of the standards for other regulated contaminants have been identified. However, there have been detections below levels considered acceptable by US EPA. This indicates the need for continued monitoring.

This report summarizes assessment results for this water system. The assessment identifies both known and potential sources of pollution occurring in the source protection area, and ranks the water source based on the likelihood of future contamination. The goal of this study is to help water suppliers, local officials, residents and consumers to learn more about source water protection. Because water quality is directly related to land use activities, everyone living or working in the source protection area has a role to play in keeping local water supplies safe.

POLLUTION RISKS:
▲ Commercial land use and waste disposal are located near the well.
▲ Roads are located near the well, increasing the risk of hazardous material spills and road salt contamination.
▲ Underground storage tanks are located inside the source protection area.
▲ Sampling indicates that the source is vulnerable to contamination.

PROTECTION OPPORTUNITIES:
▲ The majority of the source protection area consists of undeveloped forestland, which protects water quality.
▲ The town can implement land use controls and programs to protect this source protection area from future high-intensity development.
▲ The town and supplier can encourage farmers and businesses to use best management practices in handling potential contaminants.
Table 1. High-intensity land uses identified within the source water protection area that have the potential to contaminate drinking water.

</table>

1Potential contaminants include nutrients (nitrates and phosphorus from fertilizers and human and animal waste), pathogens (bacteria, viruses, and other microorganisms that can cause disease); volatile organic compounds (VOCs) found in fuels and solvents; synthetic organic compounds (SOCs), such as pesticides and plastics; and inorganics, including metals and other substances that can harm human health in high concentrations.

Figure 2. Areas of high-intensity land use are shown in dark gray.

What You Can Do To Protect Water Quality

Public Water Suppliers:
- Implement all recommendations in the latest Sanitary Survey.
- Protect undeveloped land within the wellhead or watershed protection area. Work with municipal boards and government as needed to implement land use protection measures and education programs.
- Post signs alerting public to Wellhead or Watershed Protection Area.
- Inspect water supply and protection area regularly for potential pollution sources.

Municipal Boards and Government:
- Develop a groundwater protection plan and ordinance and supporting protective zoning regulations, such as limits of paved surface areas within new developments.
- Incorporate groundwater and source water protection goals into the Comprehensive Plan.
- Implement on-site wastewater management or sewer maintenance plans and ordinances.
- Develop programs for land acquisition, conservation easements, or other critical lands protection.
- Adopt a stormwater management plan and ordinance.
- Establish a community education and outreach program that promotes residential pollution prevention and best management practices for the Public Works Department.

Residents:
- Inspect septic systems annually and pump as needed.
- Replace/repair cesspools and failing septic systems.
- Reduce fertilizer and pesticide use.
- Reduce stormwater runoff by limiting paved surface areas and maintaining good vegetative cover.
- Pick up after your pets.
- Properly use, store, and dispose of hazardous products.
- Properly maintain motor vehicles and fuel storage tanks. Consider replacing underground storage tanks with properly contained above-ground tanks.
- Check all municipal laws that may apply.

Farmers and Landowners: Develop conservation plans on agricultural and forest lands that:
- Reduce soil erosion, sediment, and stormwater runoff.
- Address proper nutrient, manure, pest, and irrigation water management.
- Address proper fuel storage and equipment maintenance.
- Conserve water, improve soil health, and protect surrounding natural resources.
- Check all federal and state laws that apply.

Commercial and Industrial Businesses:
Adhere to all laws, regulations, and recommended practices for:
- Hazardous waste management.
- Above- and underground storage tanks.
- Wastewater discharge.
- Floor drains.
- Proper training for all employees.
