

Disability and Health Risks Among Rhode Island Adults 18-64 Years of Age in 2010

Rhode Island Department of Health
Center for Health Data and Analysis & Office of Special Healthcare Needs
July 2012

Introduction

This report presents data on the demographics, health status, health risk behaviors, and healthcare access and utilization among Rhode Island adults with and without disabilities. It is based on data from Rhode Island's 2010 Behavioral Risk Factor Surveillance System (BRFSS).

About the BRFSS: The BRFSS is a telephone survey administered in all 50 states and 4 US territories with funding and specifications from the Centers for Disease Control and Prevention (CDC). The BRFSS monitors behavioral health risks that contribute to the leading causes of disease and death among adults 18 years and older in the United States. It also monitors access to healthcare and certain health conditions. Rhode Island has participated in the BRFSS since 1984.

Rhode Island's 2010 BRFSS: From January through December 2010, the Rhode Island BRFSS conducted random-digit dialed telephone interviews with 6,599 Rhode Island non-institutionalized adults age 18 and older. Among them, 4,342 were 18-64 years of age. The interviews were conducted by a professional survey organization under contract to the Rhode Island Department of Health.

This Report presents disability rates by demographic subgroups (Figure 1) and data for 28 health indicators by disability status (Figures 2 and 3) among Rhode Island adults 18-64 years of age. Respondents were defined as having a disability if they answered "yes" to either one or both of the following two questions: "Are you limited in any way in any activities because of physical, mental, or emotional problems?" and "Do you now have any health problem that requires you to use special equipment?" Error bars represent the 95% confidence limits around the values calculated from the sample data.

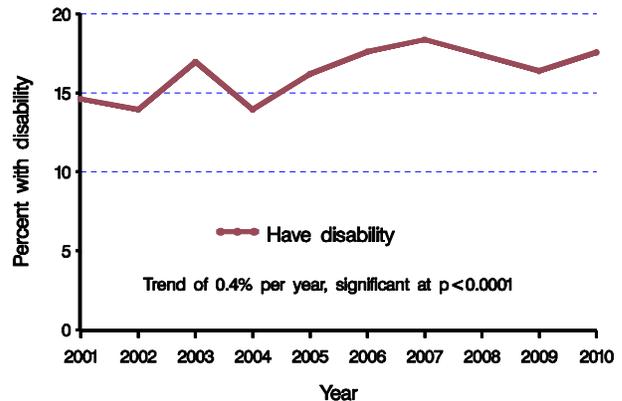

Acknowledgements: The RI BRFSS is funded in part by the Chronic Disease Prevention and Health Promotion

Programs Cooperative Agreement #U58/CCU122791 from the Centers for Disease Control and Prevention.

Report prepared by: Y Jiang, PhD, H Kim, PhD from the Center for Health Data and Analysis, and by D Garneau, MA from the Division of Community, Family Health, and Equity.

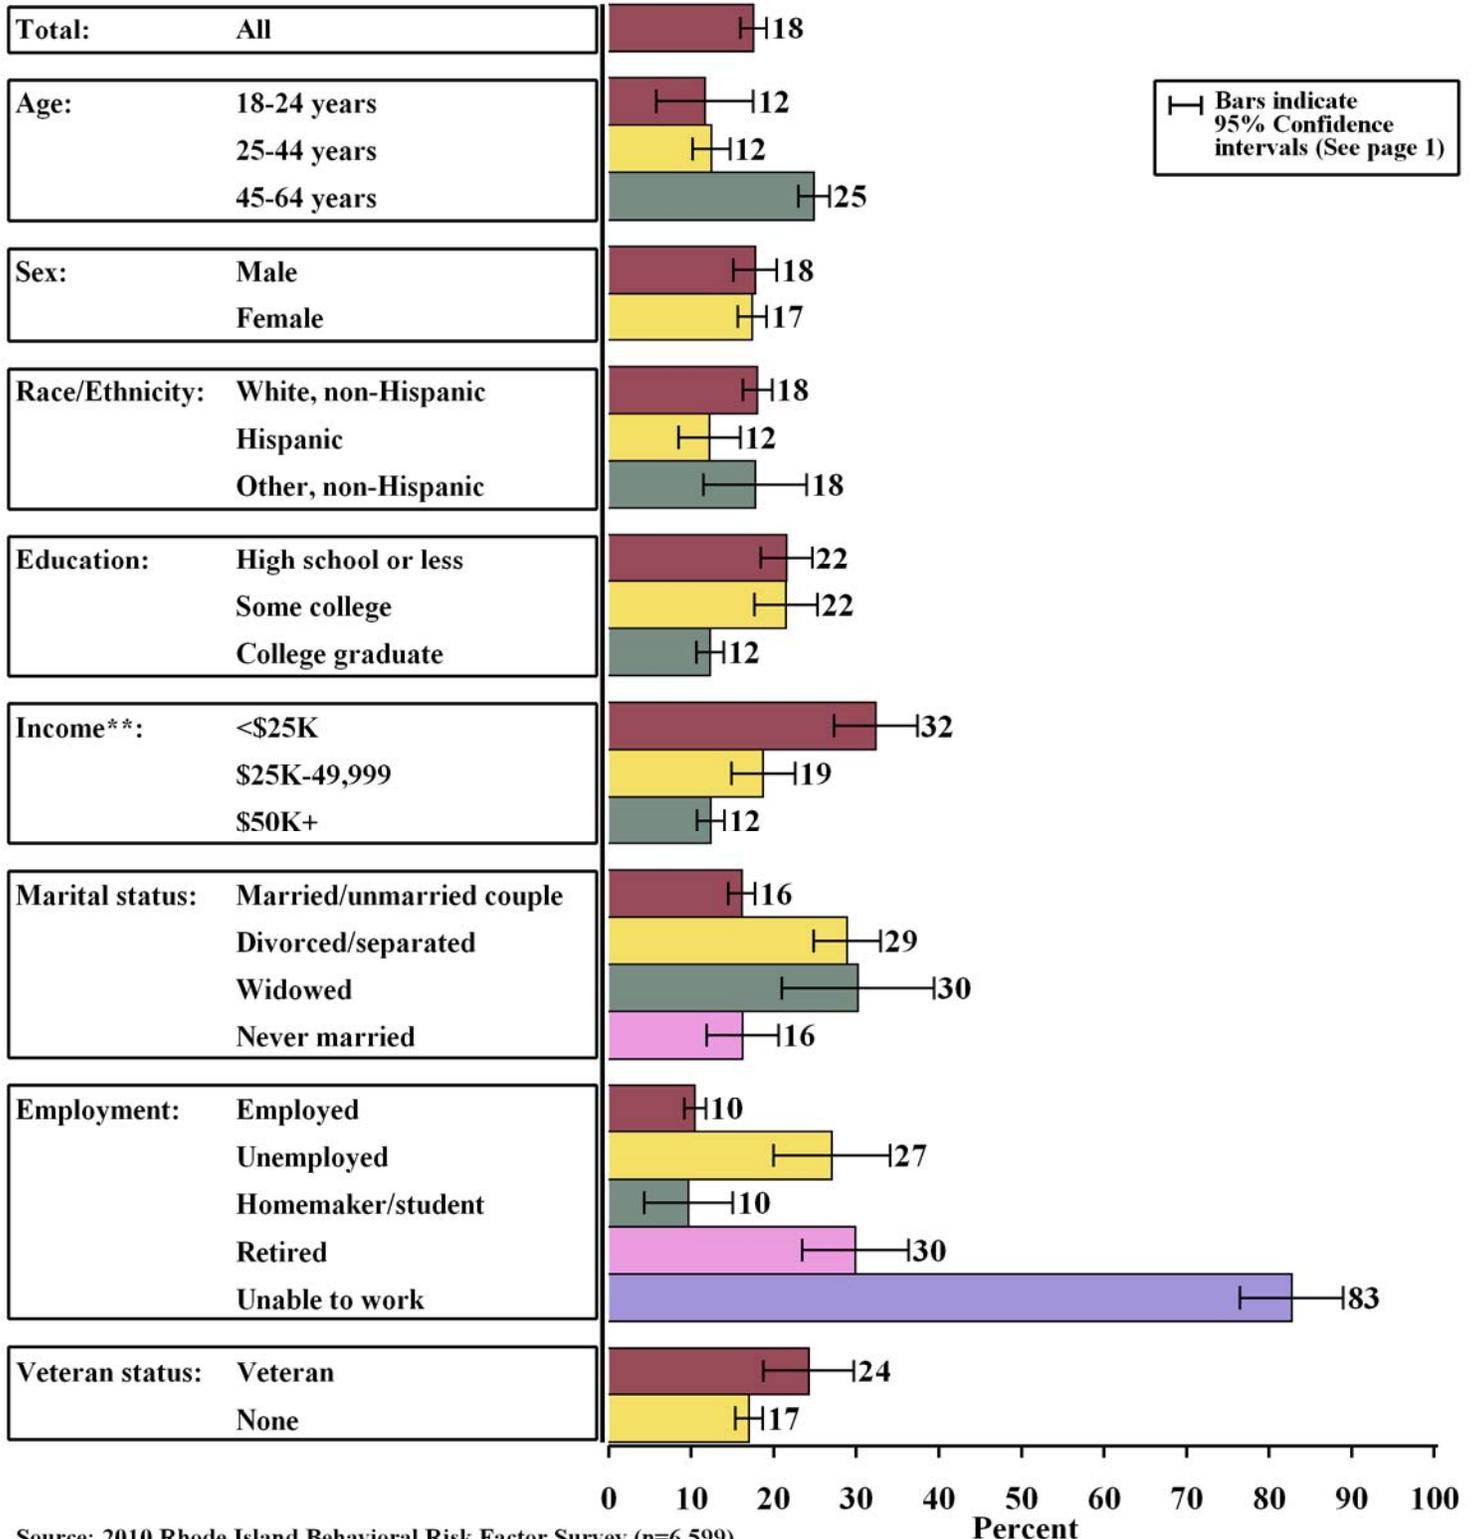

Highlights

- ❖ More than one in six (18%) Rhode Island adults 18-64 years of age had a disability in 2010. The prevalence of disability increased with age, ranging from 12% for young adults aged 18-24 to 25% for those aged 45-64. The disability rate was also higher among: adults without a college diploma (22%), those in households with annual incomes less than \$25,000 (32%), those who were widowed (30%), those who reported they were unable to work (83%), and veterans (24%). (Fig. 1)
- ❖ Rhode Island adults with disabilities, compared with those without disabilities, were just as likely to have health insurance, receive routine health checkups, and participate in preventative measures (i.e., pap smears, colorectal screening, prostate cancer screening, and flu shots). They were, however, more likely to have diabetes, asthma, coronary heart disease, and untreated dental decay, and not to have dental insurance. (Fig. 2)
- ❖ Adults with disabilities were more likely than adults without disabilities to be in poor health status, to be mentally and physically unhealthy, to have insufficient social support, and to report dissatisfaction with life. They were more likely to be obese, sedentary, smoking, and unemployed. (Fig. 3)
